

Aegis — Azure Deployment (Terraform), zero-trust

Zero-trust on Azure

1. Identity-first: managed identity per app — Postgres, Redis, Event Hubs, Key Vault and ACR all authenticate with Entra ID; zero connection strings or embedded secrets. 2. Private everything: Front Door → Private Link is the only ingress; the Container Apps environment is internal; every PaaS service has public network access disabled and a private endpoint + Private DNS. 3. Services still verify JWT signature + issuer allowlist + scope on every request (the VNet is not a trust boundary); east-west traffic is mTLS. 4. Per-tenant issuers via the gateway host; per-tenant signing keys non-exportable in Managed HSM, rotated with overlap. 5. Encrypt in transit (TLS 1.2+) and at rest (CMK for Postgres, storage, logs). 6. Guardrails + detection: Azure Policy (deny public IPs / non-private PaaS), Defender for Cloud, Sentinel analytics, WAF + NSG flow logs. 7. Operators: PIM just-in-time access + MFA + Conditional Access; CI deploys via Terraform with OIDC federation.
