

Aegis — Local Docker Deployment (docker compose), hardened / zero-trust posture

Zero-trust checklist (local)

1. One front door: only :3000 (console) and :8080 (gateway) need publishing — :9000 / :5432 / service ports are dev conveniences; remove them for a hardened stack. 2. No implicit network trust: every service validates JWT signature + issuer allowlist + scope on every call, even from inside the compose network. 3. Per-tenant issuers + keys end-to-end (issuer = http://localhost:8080/{tenant}). 4. DB-per-service; no service can read another's data. 5. Dev credentials ({noop} secrets, dev-only-change-me) are seed data ONLY — production uses a secret store and hashed client secrets. 6. Never run docker compose down -v: the pgdata volume is the persistent state.
